DeLaval Activity Monitoring System

Your key to heat detection success

- Real-time data for optimized decision-making
    - Data from radio frequency devices
    - Devices can be solar powered for cheaper, easier installation
    - Devices can repeat signal for wider coverage and 24/7 monitoring
    - When decisions are required, data is current and available

- Detect heats with up to 95% accuracy
    - Gives you confidence to trust the system
    - Does not take holidays or sick days
    - Save labor cost of manual heat detection

- System gives exact High Act start time
    - Based on research, this helps breed cows at ideal time for far greater conception success

- Based on better management of heats, time of insemination, system can reduce reproduction costs
    - Improve pregnancy rate (conception rate x heat detection rate)
    - Decrease days open and shorten calving intervals

- Ability to predict low activity or health related issues
    - Helps improve cow health by integrating with your herd management software and the other farm management tools
